IM Syllabus (2021): Computing

## IM SYLLABUS (2021)

COMPUTING IM 07
SYLLABUS

# IM07 Computing Syllabus Addendum

# Mitigating factors for 2021 MATSEC Examinations Session

Changes in Subject Content	No changes.
Changes in Coursework	Candidates will not be expected to present coursework.
Changes in Exam Paper(s)	Section A - No JAVA questions will be set; 10 questions of 8 marks each instead of 6 marks.  Section B - One compulsory JAVA Question – 20 marks.

(Available in September)
1 Paper (3 hours) + Coursework

#### 1. INTRODUCTION

This MATSEC Intermediate level Computing Syllabus has been prepared and compiled in line with previous syllabi, latest Computing related developments and space for future syllabi to add and enhance the contents. It is intended as a natural progression from SEC level Computer Studies and covers a reasonable and coherent portion of the MATSEC Advanced level Computing syllabus. It is aimed at eliciting roughly one third of the effort required in the MATSEC Advanced level Computing syllabus. It should be stressed that this is not a Computer Appreciation or a Computer Applications course. Furthermore, in line with the objectives clearly set in the previous version of this syllabus, the programming language that is to be used throughout this syllabus is to be "Java".

It is also stressed that all theoretical treatment of topics should be adequately accompanied by practical (real- world) examples when and wherever applicable.

Candidates are expected to have followed the Computer Studies stream at secondary level and have progressed on to the SEC level Computer Studies thereby acquiring sound background knowledge of the history of Computing, current and future trends, as well as the sector-specific and social applications of Information Technology.

This syllabus is ideal for those students who wish to deepen their understanding of Computing, not down to the MATSEC Advanced Computing level but enough to give a basic understanding of both the theory and techniques used in computing, together with the ability to use a programming language and basic application packages in practical situations.

This document is organised as follows. The next section briefly underlines the contents of the examination itself while syllabus details are described in detail in Section 3. Section 4 lists recommended texts and reference books that Computing educators can make use of to assist their students. Finally, detailed information regarding the assignments is expanded in Section 5.

#### 2. EXAMINATION

The examination shall consist of two parts, namely, one written paper of three hours duration and one school- based programming assignment moderated by the MATSEC Markers' Panel.

The written paper (80%) will be divided in two sections, namely:

- a) Section A (60 marks) will consist of ten compulsory short questions requiring to the point short answers.
- b) Section B (20 marks) will consist of two more in-depth questions of which the candidates will be required to answer one.

The Set Programming Assignment will be carry 20% of the total course mark.

The assignment will be set and assessed by the educators who are teaching the subject and moderated by the MATSEC Markers' Panel. This effort should be spread out over the length of the course. A list of sample topics is included in Section 5. All marks are to be submitted to the MATSEC support unit by the date stipulated by the unit.

Private candidates are to submit the assignment to the MATSEC support unit, for

assessment by the Markers' panel, by the date stipulated by the MATSEC support unit. Candidates may be called for an interview regarding their work.

## Note regarding use of calculators:

Calculators may **NOT** be used in any part of this examination.

#### 3. SYLLABUS

## **Module 1: Digital Logic**

## **Objectives**

Students should be able to:

- · understand the basics behind binary logic;
- make use, understand and draw truth tables for logic expressions;
- draw logic circuits from Boolean expressions;
- apply laws of Boolean algebra and/or Karnaugh maps to simplify a Boolean expression;
- design a combinational logic circuit using a simple practical application.

#### Content

Data Representations Decimal, Binary, Hexadecimal number systems

Converting from one base to another of the above

Binary two's Complement & Sign and Magnitude representations,

range. 8421 Binary Coded Decimal

The use of fixed point number representation to represent fractions

(binary only)

ASCII & Unicode as standard codes.

(Candidates will not be asked to explain floating point representation

of numbers)

Logic Gates Binary logic as a mathematical way of manipulating and processing

binary information Basic logic operators: AND NOT OR NAND NOR

XOR XNOR

Logic gates, truth tables and digital circuit symbols to represent simple logic solutions The use of NAND and NOR as universal gates Drawing of logic circuits from Boolean expressions, including half-

adders and full-adders.

Boolean Algebra Basic theorems and properties of Boolean algebra

Equivalence, contradictions and tautologies

The following list of laws will be assumed:

1. Commutative law.

$$X + Y = Y + X$$
;  $X.Y = Y.X$ 

2. Associative law.

$$X + (Y + Z) = (X + Y) + Z; X.(Y.Z) = (X.Y).Z$$

3. Distributive law.

$$X.(Y + Z) = X.Y + X.Z$$

4. De Morgan's law.

$$(\overline{X + Y}) = \overline{X} \cdot \overline{Y}; (\overline{X \cdot Y}) = \overline{X} + \overline{Y}$$

5. Absorption.law.

$$X \cdot (X + Y) = X + (X.Y) = X$$

6. Double complement law.

$$\overline{\overline{X}} = X$$

7. Laws of tautology.

(a) 
$$X + X = X$$
; (b)  $X.X = X$ 

(c) 
$$X + X = 1$$
: (d)  $X \times Y = 0$ 

(c) 
$$X + \overline{X} = 1$$
; (d)  $X.\overline{X} = 0$   
(e)  $X + 1 = 1$ ; (f)  $X.1 = X$ 

(g) 
$$X + 0 = X$$
; (h)  $X.0 = 0$ 

Simplification of Boolean expressions using the above laws.

Karnaugh Maps

The use of Karnaugh maps to simplify Boolean expressions. Only Karnaugh maps using up to three variables will be considered.

## **Module 2: Computer Architecture and Assembly Language**

#### **Objectives**

Students should be able to:

- gain a good understanding of the main components making up the computer system following the Von Neumann architecture;
- understand the function of the different components making up the system;
- have a clear understanding of how the different system components are connected together and how they work to give the required output;
- understand some basic assembly instructions.

#### Content

Components of a Computer System in details Input and Output Hardware Devices: Different types of input devices

and their use

Storage Hardware Devices: Diff Storage Hardware devices, Serial/

Sequential Storage Devices, Direct Access Storage devices.

The Von Neumann machine architecture

Definition of a program, Application software, Applications packages,

System software.

The concept of the Algorithm:

Definition of an algorithm, the importance of an algorithm to explain

and breakdown a problem when designing programs.

Introduction to different representations of an algorithm e.g. textual,

diagrammatic: pseudo code, flowcharts.

Overview of the Organisation of a Main PC components:

CPU

Computer System

Main Memory I/O Subsystem

The System clock

The System Bus

System bus as a means of communication between components

Address Bus Data Bus Control Bus

Buses size consideration and connection to various computer

components

Memory

RAM

The characteristics and application of RAM

Dynamic RAM Static RAM

Cache Memory (Primary level and Secondary Level Cache)

ROM

The characteristics and application of ROM

ROM EPROM PROM EEPROM CPU model and overview of main components

The fetch, decode and execute cycle with relevance to the Instruction Pointer, Current Instruction Register, Memory Address Register and

Memory Data Register.

Registers The purpose and use of internal registers in the functioning of

the CPU including

Data registers (Consider the four GP registers AX, BX, CX, DX) Stack Pointer and the stack with a description of PUSH and POP

Status or flag register considering the zero and carry flag as examples.

Assembly Language

Instruction sets

Instructions

Instruction format – opcode & operand Mnemonic representation of opcode

Only a minimal set of Instructions need to be considered: MOV, ADD, SUB, INC, CMP, JG, JL, JE, PUSH and POP

Addressing Modes Register – Example SUB AX,BX; Subtract the contents of register BX

from the contents of register AX, storing the result in AX.

Immediate - Example MOV AX,000FH; move the contents specified in

the second operand into AX

Direct – Example MOV BX,2000H - move the contents of the memory

location specified in the second operand into BX

Note students will not be asked to write programs in assembly

language

Assembler The assembly process: assembling, linking, and loading, source and

object codes.

## **Module 3: Operating Systems**

## **Objectives**

Students should be able to:

- understand the need for, and attributes of, different types of software;
- understand that system software is the interface between the hardware and user applications;
- describe different types of operating systems and their function;
- describe the different functions of an Operating System.

#### Content

Software Explain what is meant by:

System software Application software

System software Understand the need for, and functions of the following system software:

Operating Systems (OSs)

utility programs

libraries

translators (compiler, assembler, interpreter).

Types of Operating

Systems

Describe the main features of the following types of operating systems:

batch processing,

single-user (standalone), multi-user (multi-access),

multi-tasking and multi-programming,

real time control and real time transaction systems.

Identify and describe applications that would be suitable to these modes

of operation.

Functions of an Operating System

Operating Syster Interrupts: Describe the main functions of an operating system Describe the conditions which could generate interrupts.

Give an overview of interrupt handling and the use of priorities.

Describe the factors involved in allocating priorities.

Polling vs interrupts

Polled interrupts vs vectored interrupts

Memory management Describe logical and physical address spaces

Describe reasons for memory allocation.

Consequences of memory allocation: memory fragmentation and

compaction.

Memory store protection (to prevent processes from accessing storage

allocated to other jobs)

Scheduling Purpose of scheduling:

processor allocation, allocation of devices and the significance of job

priorities.

Explain how the round robin scheduling algorithm works

Explain the three basic states of a process:

running, waiting, suspended. Explain deadlock.

(Candidates are only expected to define deadlock)

File Management Explain the hierarchical structure of a directory,

Explain the different ways how to protect files, and describe file

attributes.

Providing an interface Describe the need for and the role of the operating system in providing an

interface between the used and the hardware.

Utility software Explain the need for and use of a range of utility software.

Consideration of human computer interaction - Explain the need to design systems that are appropriate to the variety of different users at all levels

and in different environments.

## Module 4: Networking and Communication

## **Objectives**

Students should be able to:

- understand the basics of transmission methods in communication;
- distinguish between different categories of networks;
- appreciate the purpose of a protocol in communication;
- appreciate the wide range Internet related technical terms and Internet applications.

Content

Point-to-point Basics of communications

Connections Simplex

Half duplex Full duplex

Analogue vs. digital

Bandwidth and baud rate

signals

Modems Modulation Amplitude Frequency

Demodulation

Transmission media

Cabling (twisted-pair, coaxial, optical fibre)

Satellites

Noise

Computer Networks

Definition and classification of a computer network

PAN LAN MAN WAN

Network Topologies

The benefits and drawbacks of basic network topologies

Bus Ring Star Mesh

Switching Techniques

The difference between various switching techniques and their

application

Circuit-switching Message-switching Packet-switching

Communication Protocols The need for standard protocols; The 7 layer OSI model and the IP

model

Transmission errors and methods to overcome them; Parity (single

and block) checking

International Network

Standards

The dotted decimal notation form of IP addressing. Internet domain naming using DNS to assign a host name to every device on the

Internet corresponding to the IP address.

and WWW-related Terminology

Integration of Internet Internet service provider, web server, web client, web browser, plugin, search engine, home page, Uniform Resource Location (URL), bookmarks, ftp, download, upload, remote login, user ID, password, Hypertext Markup Language (HTML), hypermedia, authoring tools, ISDN, ADSL, Proxy Servers, Hubs and routers (only broad knowledge is expected from the students). The need for standard protocols.

Electronic Activities

E-mail: e.g. send plain text messages, attaching files.

E-Commerce: e.g. Business to consumer, purchasing on-line.

E-Business e.g. Business to Business, EFT

Remote Access: e.g. Working remotely, logging on remotely

An overview of the above electronic activities is examined. Comparisons including advantages and disadvantages of the above

when compared with traditional methods are also expected.

Social Implication of Computing

Computer Crime Privacy of Data

Data Protection Act overview, with reference to the Maltese legislation

Web 2.0 Plagiarism

## Module 5: High Level Language Programming

## **Objectives**

Students should be able to:

- understand and appreciate the need for programming;
- differentiate between the various mainstream programming paradigms;
- identify, understand and use the basic programming and data structures;
- have a good understanding of the fundamental concepts of object oriented programming including objects and classes.

#### Content

The concept of the Algorithm

Definition of an algorithm, the importance of an algorithm to explain

and breakdown a problem when designing programs.

Introduction to different representations of an algorithm e.g. textual,

diagrammatic: pseudo code, flowcharts.

Introduction to control and data structure of an algorithm.

High Level Languages

Introduction to programming paradigms

Characteristics of each programming paradigm, including imperative,

object-oriented and formal.

Computer Language Translation Source Code, Translation including differences between Compilers, Interpreters, Assemblers. Machine Object Code. Pseudo Machine.

Description and applications of various compilers & techniques should be overviewed. Details and functioning of these translators should not

be tackled

Expressions and data Types

The objectives of the following include an understanding of

Simple java programs that utilise print and println,

Java style comments,

Primitive data types: char, int, double, and boolean,

Operator precedence,

Relational operators <, <=, >, >=, ==, !=

String literals,

Expressions composed of primitive data types and,

Expressions that mix data types.

Variables and assignments

The objectives of the following include an understanding of

The concept of a variable as a named memory location,

Variable declarations and initialisations,

Assignment and Java's assignment operators: =, +=, -=, \*=, /=, and

%=,

The use of a Scanner object for interactive input,

The advantages of using final variables

Type compatibility and casting,

Pre-increment and post increment (++ x, x++, --x, x--) and

Shortcuts (x = x + 10 can be shortcut to x += 10).

Selection and decision

The objectives of the following include an understanding of:

Selection as a mechanism for controlling the flow of a program;

The **if** statement, the **if-else** statement, and **Switch** statement and Nested **if-else** statements.

Repetition/ Iteration

The objectives of the following include an understanding of

Repetition and loops: the while, do-while, and for statements;

The differences and similarities among the while, do-while and for

statements; Nested loops; Infinite loops.

Methods

The objectives of the following include an understanding of:

The concept of a method as a "black box";

The methods of Java's Math class\*

How to construct methods that carry out simple tasks;

The differences between void methods (setters) and methods that

return a value (getters);

Local variables; Method overloading.

\*Only the following methods are to be used: Math.random(),

Math.round(x), Math,max(x,y), Math.min(x,y), Math.pow(x,y), sqrt(x)

Objects and classes

The objectives of the following include an understanding of:

Objects and classes;

Programmer defined classes;

Components of a class: constructors, instance variables and methods;

Overloading of constructors and methods; Access modifiers: public and private; Encapsulation and information hiding;

Inheritance;

Static variables and static methods;

Parameter passing (passing by value or by reference);

The keyword *this* 

Arrays

The objectives of the following include an understanding of:

Array declarations (single and two dimensional) instantiation, initialisation, filling in an array with data, displaying data from an

array;

How arrays are passed to methods and used in methods;

Sorting an array using bubble sort algorithm only;

Searching an array using linear search.

Array of Objects.

Data structures

Purpose of data structures algorithms

Stacks

Basic knowledge of the concept of a stack as a data structure.

Queues

Basic knowledge of the concept of a queue as a data structure.

Linear Lists

Basic knowledge of the concept of lists

Other structures

Arrays - single and two dimensional

Creating an array

Filling in an array with data.

Displaying data from an array

Basic knowledge of sorting algorithms in general with special reference to bubble and insertion sort. Sorting Algorithms

Searching Algorithm Linear Search

## **Module 6: Systems Design**

## **Objectives**

Students should be able to:

- understand the basic principles of systems analysis and design;
- develop a practical knowledge of the accepted mainstream stages of a software development life-cycle;
- appreciate the structure and use of the fundamental development methodologies.

#### Content

Software systems The importance of thinking before doing

A software development life cycle (simplistic "Waterfall")

Overview of the

System

The main stages of a system life cycle:

Problem Definition Feasibility Study

Requirements Elicitation

Analysis Design

Implementation

Testing Maintenance

Problem definition What prompts an organisation to develop a new system:

current system may no longer be suitable for its purpose;

technological developments;

current system may be too inflexible or expensive to maintain;

required to gain a competitive advantage.

Feasibility study Preparation of a study containing the scope and objectives of the

proposed system.

Requirements

Elicitation

Understanding the problem completely through:

Interviews; Questionnaires;

Inspection of documents;

Observation (of existing system and work processes).

System Analysis Using data flow analysis to describe system function (Data flow diagrams)

as the principle analysis tool.

System Design Modular system structuring

Top down and bottom up design approaches The use of pseudo code and/or flowcharts

Implementation User guides and in-code comments.

Change-over techniques (basic idea behind and comparison of):

Direct;

Parallel running; Phased transition

Fundamentals of testing Differences of alpha and beta testing.

 $\ensuremath{\mathrm{I/O}}$  testing in the form of validation of inputs and outputs through the creation of testing data within testing ranges.

Comparison between black and white box testing concepts.

Maintenance Types of maintenance:

Adaptive Corrective Perfective

Standard methodology A top level overview of UML.

## **Module 7: Databases and Database Management Systems**

## **Objectives**

Students should be able to:

- understand the basic structure, function and importance of database management systems (DBMS);
- appreciate the importance of relational databases over traditional file systems;
- understand the logical structure and design of a relational database.

#### Content

The structure and Data dictionary

functions of database Data manipulation language (DML) management systems Data description language (DDL)

(DBMS) Query language

Database The responsibilities of a database administrator.

Administrator (DBA) The role of the DBA in the design and maintenance of the database.

Database models The two main type of database models namely:

Relational models
Object-Oriented Model

Databases vs. Flat File Systems The advantages and disadvantages of databases over traditional file systems including: improved data consistency and portability, control over data redundancy, greater security, increased maintenance.

tables linked together using common fields.

The purpose of primary, secondary and foreign keys, fields, records.

Attributes & tuples. Compound Keys.

Normalising relational

databases

Candidates must appreciate that the great advantage of using Relational database is due to the normalisation process which is

applied on it.

Candidates **are not** expected to normalise databases, but rather understand the concept behind normalisation to reduce duplicate

data

## **LIST OF ACRONYMS**

ADSL - Asymmetric Digital Subscriber Line

ATM - Asynchronous Transfer Mode

BNF - Backus Naur Form

DMA - Direct Memory Access

ROM - Read Only Memory

EEPROM - Electrically Erasable Programmable ROM

EPROM - Erasable Programmable ROM

FTP - File Transfer Protocol

HDSL - High bit-rate Digital Subscriber LineISDN - Integrated Services Digital Network

LAN - Local Area Network

MAN - Metropolitan Area Network

PROM - Programmable ROM
USB - Universal Serial Bus
WAN - Wide Area Network

#### 4. FURTHER INFORMATION REGARDING THE ASSIGNMENTS

#### **4.1 Suggested Areas for Assignments**

**It is important,** that all assignments be fully documented, with clearly defined explanations of any decisions taken and approaches adopted, together with a description of possible fields of application for the object of the assignment.

The following are some generic examples of areas to which programming assignments can be related. However, it should be noted that teachers are free to choose any sort of programming example from any field that best suits their needs and expectations.

## Mathematical type of problems:

Finding statistical mean, root mean square, finding the maximum and minimum of a set of numbers, compound interest, depreciation.

## Iterative types of problems:

Factorials. Simple permutations. Combinations. Problems involving repetitive tests with loops and nested loops.

## Character graphics problems:

Area filling with characters. Cursor movement. Problems involving text screen handling. Use of extended character set. String manipulation problems: Abbreviations case conversion, simple string sorting. Simple string searches. Use of string arrays.

## Mapping problems:

Mapping structures onto strings. Mapping bit information into binary numbers e.g. maze representation in binary entries. Simple encryption problems.

## Data management problems:

File handling utilities and environments. Database construction and management. Operations on data (sorting, searching, shifting, etc.). Stock handling programs. Simple statistical analysis.

**Note:** This assignment should include a brief description of the functionality and structure of the program. The program should be well-structured, well documented, and evidence of adequate testing should be documented.

## 4.2. Assignment Marking Scheme

#### **Problem Definition**

Presentation and clarity of the problem chosen:

The way the problem is presented and explained to the reader: whether the problem involves a computerisation of an existing manual system e.g. a student database or an original application e.g. a game

How well the shortcomings are identified and what are the specifications the new system should have including forecasted limitations and constraints.

[5]

## **Programming elements**

Assignment design:

The way classes are designed and explained, using standard tools. Systems Analysis using ONE Level 0 Context Data Flow Diagram and arising Use-Case and Class Diagrams.

[10]

Sub-program design:

Explanation of sub-programsused which use standard algorithms, e.g. through the use od pseudocode or flowcharts

[5]

Good use of JAVA programming elements including, use of: primitive data types, variables, pre/post tested loops, conditional & switch statements, methods with and without parameters, arrays.

[25]

## Algorithms & Logic

Efficient algorithms:

Credit should be given to candidates who design & employ good programming algorithms for sorting, efficient searching techniques and algorithms which make code re-usable and non-redundant

[5]

Flow of application

A good, logical flow of application execution with good data transfer, logical sequence of events, robustness in program structural design to ensure the actual flow of running matches with the intentional design.

[5]

Interface Efficiency

Credit to the interface which allows the easiest and most efficient navigation, shows a good design and is simple in built.

[5]

## **Object Oriented Principles**

Use of programmer's designed Classes and Objects

The level and quality used in designing own classes which create Objects and the way these Classes are integrated to the main application. How well encapsulation is ensured throughout the running of the program.

[5]

Inheritance:

Design and use of Inheritance principles to reduce the redundant code, including normal inheritance.

[5]

## **Application of JAVA API's**

The use of JAVA standard API's such as packages (e.g. javax.swing, java.awt, java.util etc.) and their respective classes

[5]

## **Solution Evaluation and Testing Procedures**

#### **Evaluation:**

In the form of an overall critical appraisal of the assignment, indicating whether or not the assignment goals have been reached. This should be accompanied with justification for any deviations from the original plan.

[5]

## Testing Description:

How well the testing is designed, what strategies are employed and how well the test cases are chosen and presented.

[5]

## Evidence of testing:

Evidence and documentation of test results according to test cases with input, output, expected output, and screen shots, showing program execution.

[5]

#### User's manual:

A concise, but complete, user's manual with clear, annotated screen shots, aimed at non-technical, end users explaining how the application can be installed and used.

[5]

## Conclusion & Future Improvements:

This should highlight the benefits of the current system, and any areas in the assignment that could be improved upon in any future iteration.

[5]

#### 4.3 Accredited Schools

Schools presenting candidates for this examination must normally offer full-time courses in Computing and must be accredited by the Maltese education authorities.

It is the responsibility of schools presenting candidates for this examination to ensure that they are properly equipped with the appropriate hardware equipment and software packages for any project work set for the candidates. No concession for candidates lacking the right tools and equipment will be made by the MATSEC Board.

The allocated teacher reserves the right to interview any candidate of his/her choice regarding the content of the candidate's submitted assignment.
